

**Amendments to the Specification**

Please replace the 5<sup>th</sup> paragraph on page 3 of the specification with the following amended paragraph:

In preferred embodiments, the ulterior surface of the side wall of the base are substantially vertical. Insects with feelers ~~sense~~ can often sense hostile surfaces using those feelers. The vertical interior surface of the wall therefore masks the tacky surface on to which the insects eventually fall. Once on the tacky surface the insects become stuck and cannot escape.

Please replace the 2<sup>nd</sup> paragraph on page 5 of the specification with the following amended paragraph:

The base 11 has an upright member which forms a side wall 16 defining a space 17 into which an insect attracting sheet (not shown) may be inserted. The insect attracting sheet lies on the floor 15 of the base 11 surrounded by the side wall. The side wall 16 has four interconnected sections and has an exterior surface 16' which slopes upwardly and an interior surface 16[""] which is vertical. The front portion of the side wall 16 has two semicircular clips 24 which extend from the interior surface 16' into the space 17 which accommodates the sheet. These clips 24 are located above the floor 15 and each define a notch into which the front or leading edge of the sheet can be placed. The clips are positioned around 15 mm in from the respective interior corners of the base 11. The clips extend around 1 to 2 mm into the space 17.
